

# ERRATUM

Cotcheside, D. E. A. Gene order in linkage group V of *N. crassa*.

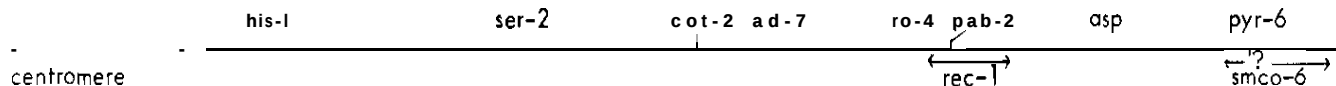

The linkage map for group V markers summarizing the data in Cotcheside (1973 NN#20: 43) was imprecisely redrawn from the manuscript version and in the process become misleading. The published version implied that with the exception of rec-1 and smc-6, the order of the gene loci was certain. The data are, in fact, not adequate for this; the order of ser-2 with respect to cot-2 being based only upon two point data and the order of ro-4 with respect to pab-2 being arbitrary since no recombinants have been observed.

New three point data confirm the order for ser-2 and cot-2 (Table 1), but the order of ro-4 with respect to pab-2 remains equivocal.

Table 1

| Cross number | Zygote genotype and<br>% recombination |  |  |  | Parental types |   | Recombinants |   |     | Total | % Germination | Allele numbers      |
|--------------|----------------------------------------|--|--|--|----------------|---|--------------|---|-----|-------|---------------|---------------------|
|              |                                        |  |  |  |                |   | 1            | 2 | 1,2 |       |               |                     |
| 5366         | am-1 his-1 + c2 +                      |  |  |  | 79             | 9 | 6            | - | -   | 185   | 92.5          | (47305)             |
|              | + + (4.9) <del>cot-2</del>             |  |  |  | 84             | 4 | 3            | - | -   |       |               | (K83)               |
|              | (7.0)                                  |  |  |  |                |   |              |   |     |       |               | (65004)<br>(R1006t) |

The revised map, including new data, being:

where gene order is uncertain unless the line indicating locus position intersects the map line.
