Disease Reaction of Sorghum Hybrids to Infection by Maize Dwarf Mosaic Virus Strains A and B

**D. L. Seifers and Dave Karr
Fort Hays Branch Station**

Maize dwarf mosaic of sorghum, *Sorghum bicolor* (L.) Moench, is caused by maize dwarf mosaic virus (MDMV). Infection of sorghum by MDMV produces variable symptoms depending on virus strain, plant genotype, and temperature. Infection causes a yellow to dark green pattern (mosaic) and, on certain genotypes, a necrotic reaction (red-leaf) develops when the temperature drops below 21°C (69°F). Hybrids expressing the mosaic reaction when the temperature drops show less reduction in yield than plants with red-leaf symptoms. Immunity to MDMV is not present in commercially available hybrid sorghums.

Procedure

Studies were conducted at the Fort Hays Experiment Station. Sorghum hybrids were tested for MDMV-A disease reactions under both greenhouse and field conditions. Disease reaction to infection by MDMV-B was tested only in the greenhouse. In greenhouse tests, sorghum hybrids were planted in metal flats with 15 seeds/entry and 33 entries/flat. Seedlings were inoculated at the two-leaf stage with a Devilbiss atomizer (7.0 kg/cm²-100 lbs/in² air pressure). Inoculated

plants were maintained at $27 \pm 4^{\circ}\text{C}$ ($80 \pm 4^{\circ}\text{F}$) in the greenhouse. Control plants, inoculated with buffer and abrasive only, were maintained in the same environment.

The presence of mosaic symptoms was noted 14 days following inoculation. Test plants were then placed in a growth chamber at 15°C (59°F). Four days later, plants were returned to the greenhouse, and the presence of red-leaf symptoms was noted. Greenhouse tests were repeated three times.

Field-grown plants at the two- to three-leaf stage were inoculated with a Devilbiss EGA-502 spray gun attached to a 3.5L (1 gal) inoculum reservoir. Compressor line pressure was maintained at 7.0 kg/cm^2 (100 lbs/in^2). Notes on red-leaf development were recorded at weekly intervals during the growing season beginning 2 weeks after inoculation. Planting was delayed until late June to assure cool temperatures for induction of red-leaf necrosis.

Results

Reactions of all hybrids tested are shown in the table.
