Effects of Supplementing Corn Silage with MGA¹ and
Feeding Varying Levels of Sorghum Grain
to Feed-lot Heifers

L.I. Smart and C.L. Drake

Melengestrol acetate (MGA) is a new drug recently approved for use in the supplement portion of rations of feed-lot heifers. The recommended level is from 0.25 to 0.50 mg. per head per day. A 48-hour withdrawal period is required before slaughter. Several experiment stations have shown improved rate of gain, feed utilization and suppressed estrus in feed-lot heifers on high concentrate rations plus MGA.

Recently there has been much interest in feeding more silage to feed-lot cattle. Since more pounds of beef can be produced per acre farmed with silage than with grain, it seems reasonable that more silage should be fed. The amount of grain needed to supplement silage for best results has not been determined.

Primary purposes of this study were to:

1. Evaluate effects of MGA with high corn silage rations.
2. To study the effects of adding varying amounts of sorghum grain to corn silage.
3. Try to determine the best time during the feeding period to add grain.
4. To determine the effects of MGA and grain on carcasses of silage-fed heifers.

¹ MGA furnished by Upjohn Company, Kalamazoo, Mich.

Materials and Methods

Eighty Hereford heifers averaging 678 pounds each were divided into 8 lots of 10 each. All were full fed corn silage plus the amount of grain for 112 days as indicated in table 19. Carcass data were obtained after the heifers were slaughtered.

Protein supplements were adjusted to keep the protein level approximately the same among all rations. The chemical analyses of the corn silage are presented in table 20.

Results and Discussion

Feed-lot results are presented in table 21. All MGA lots gained faster than the corresponding lots without MGA. The addition of grain increased the cost of gain. There were no real differences in carcass data as presented in table 22.

Table 19
Daily Treatment Per Head

<u>Lot No.</u>	<u>Treatment</u>
3	Corn silage ad libitum Rolled sorghum grain fed at 0.75% of average body weight adjusted every 28 days. 2 lbs. of protein supplement
4	Same as lot 3 except supplement contained 0.35 mg. MGA
5	Corn silage ad libitum Rolled sorghum grain fed at 1.5% of average body weight adjusted every 28 days. 2 lbs. of protein supplement
6	Same as lot 5 except supplement contained 0.35 mg. MGA
9	Corn silage ad libitum Rolled sorghum grain fed the last 56 days at 1% of average body weight the first 28 days and 2% the last 28 days. 2 lbs. of protein supplement
10	Same as lot 9 except supplement contained MGA
11	Corn silage ad libitum until last 28 days then reduced to 6 pounds. Rolled sorghum grain fed to consumption last 28 days. 2 lbs. of protein supplement.
12	Same as lot 11 except supplement contained MGA
